

### **Breaking news!**

Remoticom markets a **social distance sensor**, under the product name **Sodisense**, which will offer the intelligent lockdown an extra option. With the Sodisense sensors we can go to the 1.5 meter society that we have to adopt for a certain period. This is to protect each other's health as simply as possible.

The social distance sensor works on an innovative technique and measures distances to each other with an accuracy of 10 cm, whereby our sensor will give a notification by means of vibration at an adjustable distance. As a result, the environment is not constantly beeped, but the people themselves notice that they are too close to another person.

The social distance sensor comes in the form of a wrist module, a key cord and key-chain version and a module for the safety helmet.

The social distance sensor can be used in the following environments:

- Construction sites and infrastructure
- Markets
- Office environment
- Warehouse and transshipment depots
- Production facilities
- Shops and hardware stores
- Schools and childcare
- Hospitals and nursing homes
- Cinemas, casinos and museums
- Restaurants and other eateries
- Cafés and terraces
- Gyms and sports canteens

The social distance sensor is one of the innovative solutions that Remoticom will now introduce in the market to make our contribution to an intelligent, healthy society.

Remoticom is an Internet of Things (IoT) developer and was established in the Netherlands in 2015 and has since focused on intelligent sensor technology. Remoticom strives to make the living and working environment safer, more efficient, more intelligent and more sustainable. Our slogan is **“Made smart for you”** for a reason.
