ABOUT US

Remoticom is an expert in the field of Internet of Things and sensor technology. We develop smart sensor systems that contribute to a safer and more comfortable living environment. We can help you from start to finish, from development to production. This makes Remoticom very flexible.

LPWAN

Remoticom is using the Low Power, Wide Area Network (LPWAN). These networks have a very efficient power consumption and can be used in places that are difficult to reach. The low power consumption of the network enables us to develop battery powered sensors, that last up to ten years. The strong coverage of the network ensures that we can develop products for almost every environment.

**REMOTICOM
PORTAL.**

RTM-PORTAL

REMOTICOM PORTAL

Our sensors are designed to measure values in the most accurate way. The user can read the measured values in the Remoticom portal. When a customer purchases a Remoticom device, our engineers will add it to the portal before delivery. When it is all set, the customer will receive an e-mail with the login details, so it can get started right away.

INSIGHTS

All data that is collected by your Remoticom product, is displayed in the Remoticom portal. The data is shown realtime or in a historical overview. If the device or connection fails, you optionally receive an automatic warning.

The following data can be displayed in the portal:

- Primary current
- Secondary current
- Primary voltage
- Secondary voltage
- CO₂
- RSSI
- Water level
- Open/close
- Etc.

CONTROL

The Remoticom portal makes it possible to control your device remotely. This can be done realtime or by means of a schedule. For example, you can immediately dim street lighting or set a time schedule that ensures that the lighting is only dimmed at specific times. Another example is opening/closing fences by use of the Remoticom portal.

It is possible to create product groups which enables controlling multiple products at the same time.

EASY ACCESS

After delivery of the products the user will receive an email with the login details. Before delivery, the devices are added to the portal by Remoticom. When you login to the portal you can start immediately.

FILTERS

The Remoticom portal is designed to make sure the user can always find the right product out of long product lists. The user can filter by client, group, device type, status of the device, the location of the device or the product name.

OPEN API

Data that appears in the portal via your device can be transferred to your own platform via an open API.

Report generator
Easily create reports on single products or product groups.

Safe connection
Remoticom uses VPN to send data to the portal in a secure way.

Emergency mode
By using the emergency mode, all devices in a specific area can be controlled simultaneously.
